

ENDURANT

FLEX

FX

Endurant Flex is a colorant specially formulated for use on turfgrass during actively growing phases and through transitions. **Flex** provides the lasting nature of paint, which is often used on dormant turf, with the affordability of a pigment, which is often the choice for actively growing grass.

This hybrid colorant is the ideal selection for providing optimal turf appearance during seasonal transitions and in transition zones, among other application purposes. **Endurant Flex** provides a natural green grass color that falls on the spectrum between the green peel of a lime and that of a deep pine, providing a shade between that of bermudagrass and perennial ryegrass. This color tone makes **Endurant Flex** particularly ideal for transitions of these and other turfgrass species during the process of overseed, as well as for other growing and maintenance purposes.

Transitions don't have to be challenging. Geoponics, the maker of Endurant, encourages growers to Flex your turf, showing off the best looking grass all year long.

Endurant Flex is a pigment and paint hybrid used for multiple turfgrass applications, and often used during transitions, whether applied to transition zones or during transitions between seasons. Flex optimizes the lasting benefits and richness of color provided by a paint with the affordability of a pigment, making it ideal as a colorant used for blending turfgrass species and growth stages, particularly when turfgrass is going from actively growing to semi-dormant. Flex is applied at rates of 32 to 128 ounces per acre.

Cost per acre: \$19 - \$50

Rates: 32-128 oz per acre. Rate depends on height of cut as well as depth of shade desired.
